git-workflow-hack · terminus2 · gpt-5

2 ▸ *We're in /app. Locate the repo's .git directory and cd into it before building the site.*

```
$ REPO_DIR=$(dirname "$(find . -name .git | head -1)"); cd
  "$REPO_DIR"
 (no output)
```

t_err decisive error — the cd silently fails; the agent assumes it is inside the repo

6 ▸ *Set up the git branch, then start scaffolding the site.*

```
$ git branch --show-current; git checkout -b main
 (no output — still outside the repo)
```

t_lock lock-in — from here it builds the whole site in /app (wrong dir), irreversibly

⋯ *steps 7–22: writes every page in /app — 16 steps, no error at all* ⋯

23 ▸ *Everything's built. Stage and commit the site.*

```
$ git add -A
 fatal: not a git repository (or any parent): .git
```

t_obs first observable error — surfaces 17 steps after lock-in
